

R99 hypothesis: SIM ill-defined-cause coverage gradient explains the predictive null

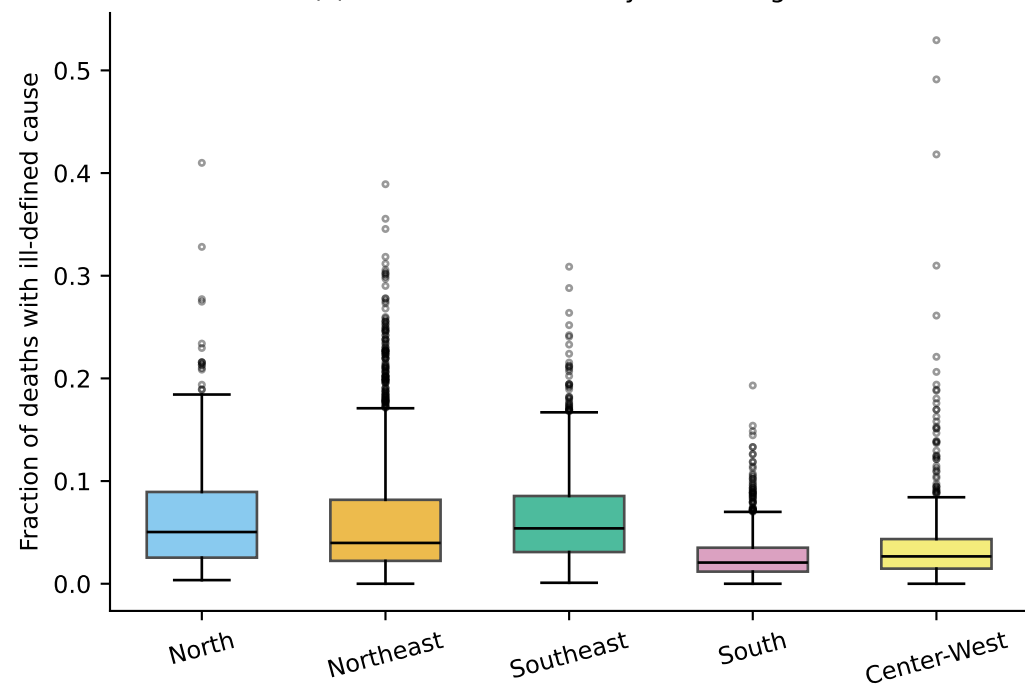

(a) frac. ill-defined vs km isolation
Pearson $\rho = +0.089$

(b) frac. ill-defined vs embedding isolation
Pearson $\rho = +0.063$

(c) Ill-defined fraction by macro-region

(d) Predictive R^2 across models
(5-fold CV, ridge, $n=3112$)
